

1ST

## MATLAB - Lectures 1<sup>ST</sup> SEMESTER

### LAB 1 IMPORTING AND EXPORTING DATA

Topics Covered:

1. The **load** command.
2. The **save** command.
3. The **xlsread** command.
4. The **xlwrite** command.

This is **useful** to know **how** to use **save** and **load** to transfer variables between the Workspace and a disk file.

1

1ST

### IMPORTING AND EXPORTING DATA

### IMPORTANCE DATA IN A MODEL

- What is a **model** ?
- The Atmospheric Science community includes a large and energetic group of researchers who devise and carry out measurements in the Atmosphere. This work involves instrument development, algorithm development, **data** collection, **data** reduction, and **data** analysis.
- The **data** by themselves are just numbers. In order to make physical sense of the **data**, some sort of **model** is needed. This might be a qualitative conceptual **model**, or it might be an analytical theory, or it might take the form of a **computer program**.

2

1ST

## IMPORTING AND EXPORTING DATA INPUT/OUTPUT (I/O) DATA

- ❑ **Importing data** is the process of retrieving(Input) data from sources external an ASCII text file.
- ❑ **Exporting data** is the process of extracting(Output) data from an instance of output data into some user-specified format .
- ❑ **load** and **save** are used to **import** and **export** data.

3

1ST

## IMPORTING AND EXPORTING DATA

### Other import/export functions

- ❑ with differing degrees of flexibility and ease of use, include **csvread**, **csvwrite**, **dlmread**, **dlmwrite**, **fgets**, **fprintf** (which has an optional argument to specify a file), **fscanf**, **textread**, **xlsread** , **xlswrite** You know where to look for the details!
- ❑ '-mat' Keyword that indicates that the specified file is a MAT-file.
- ❑ '-ascii' Keyword that indicates that the specified file is an ASCII file.

4

**IMPORTING AND EXPORTING DATA**

1ST

**1. The save command :-**

If you want to store the data into an ASCII dat-file (in the **current directory**), make the filename the same as the name of the data and type *'/ascii'* at the end of the *save* statement.

**Syntax****save** (filename)

Save all workspace variables to (...-.mat)

**save**(filename, variables)

stores only the specified variables

**save** (filename, ... ,format)

saves in the specified format '-mat' or '-ascii'

5

1ST

**Ex:-** Save data to an ASCII file ,and view the contents of the file with the type function.

```
>> p = rand(1, 10);
>> q = ones(10);
>> save('pqfile.txt','p','q','-ascii')
>> save('pqfile.mat','p','q','-mat')
or
>> save pqfile.txt p q -ascii
>> save pqfile.mat p q -mat
```

➤ The extension -.mat is the default—you can specify a different extension.

6

1ST

## IMPORTING AND EXPORTING DATA

### 2. The **load** command :-

The **load** command is the reverse of save. It is used to Importing text (ASCII) data or load data from MAT-file into workspace .

**Syntax**

**S=load** (filename)

**S=load** (filename, variables)

**S=load** (filename, format ,variables) load in the specified format'-mat' or '-ascii'

**load** (filename,\_\_\_ ) loads without combining MAT-file variables into a structure array .

7

1ST

## IMPORTING AND EXPORTING DATA

```
>> p = rand(1, 10);
>> q = ones(10);
>> save pqfile p q
>> clear all
>> p
Undefined function or variable 'p'.
>> load pqfile p q
>> p
>> q
```

8

1ST

## IMPORTING AND EXPORTING DATA

### EXAMPLE 1: THE PRECIPITATION

This example show you how to load a simple data set and plot it.

The PDXprecip.dat file contains two columns of numbers. The first is the number of the month, and the second is the mean precipitation recorded at the Portland International Airport between 1961 and 1990. Here are the MATLAB commands to create a symbol plot with the data from PDXprecip.dat.

9

1ST

## IMPORTING AND EXPORTING DATA

### EXAMPLE 1: THE PRECIPITATION

PDXprecip.dat

|    |      |
|----|------|
| 1  | 5.35 |
| 2  | 3.68 |
| 3  | 3.54 |
| 4  | 2.39 |
| 5  | 2.06 |
| 6  | 1.48 |
| 7  | 0.63 |
| 8  | 1.09 |
| 9  | 1.75 |
| 10 | 2.66 |
| 11 | 5.34 |
| 12 | 6.13 |

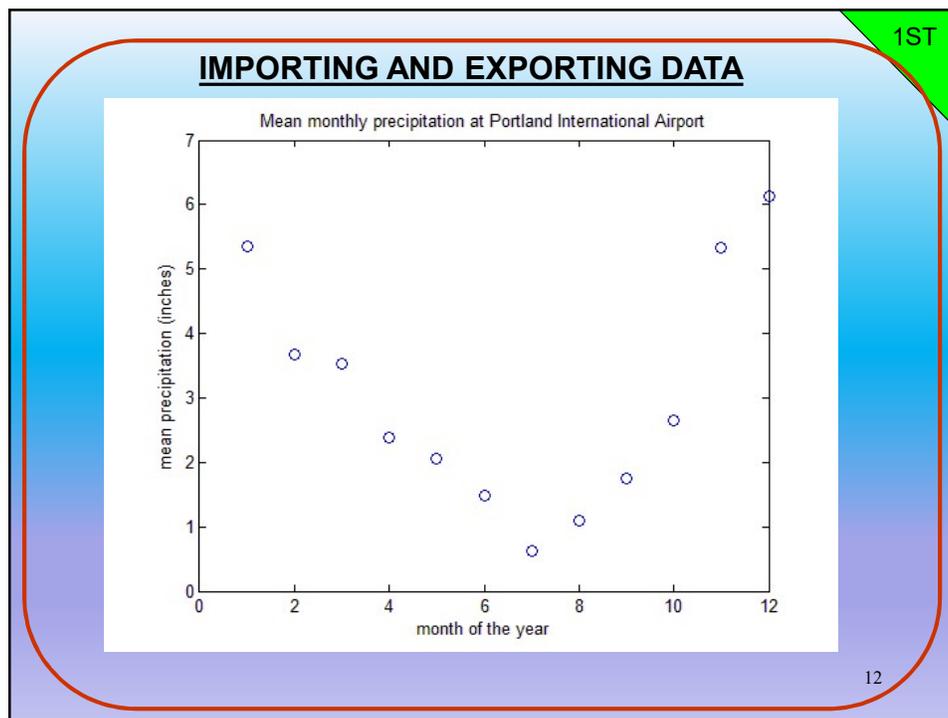

✓ Documents → MATLAB → R.Click :New → Text Document  
write the table above and save it as PDXprecip.dat

10

1ST

```
script-file precipPlot.m :  
% Filename: precipPlot.m  
% Load data from PDXprecip.dat and plot it with symbols  
% read data into PDXprecip matrix  
load PDXprecip.dat;  
% copy first column of PDXprecip into month and second  
% column into precip  
month = PDXprecip(:,1);  
precip = PDXprecip(:,2);  
plot(month , precip,'o');    % plot precip vs. month with circles  
xlabel('month of the year'); % add axis labels and plot title  
ylabel('mean precipitation (inches)');  
title('Mean monthly precipitation at Portland International Airport');
```

11

1ST

**IMPORTING AND EXPORTING DATA**

**3. The xlsread command :-** Read Microsoft Excel spreadsheet file ( .xlsx ),retrieving or Importing data .

**Syntax**

num = **xlsread**(filename)

num = **xlsread**(filename , sheet)

num = **xlsread**(filename , xlRange)

num = **xlsread**(filename , sheet , xlRange)

num = **xlsread**(filename , sheet, xlRange ,'basic')

[num , txt , raw] = **xlsread**(\_\_\_)

\_\_\_ = **xlsread**(filename,-1)

13

1ST

**IMPORTING AND EXPORTING DATA**

**num= xlsread**(filename)

- Read and returns numeric data in **double** array **num** from the first sheet in the Microsoft Excel spreadsheet file named **filename**.

**num= xlsread**(filename,-1)

- Opens the file **filename** in an Excel window, enabling you to interactively select the worksheet to be read and the range of data on that worksheet to import.

**num= xlsread**(filename, sheet)

- Reads the specified worksheet, where **sheet** is either a positive, double scalar value or a quoted string containing the sheet name.

14

1ST

### IMPORTING AND EXPORTING DATA

num= **xlsread**(filename, xlRange)

- Reads data from a specific rectangular region of the default worksheet (**Sheet1**). Specify **range** using the syntax '**C1:C2**', where **C1** and **C2** are two opposing corners that define the region to be read.

num=**xlsread**(filename , sheet, xlRange)

- Reads data from a specific rectangular region (**range**) of the worksheet specified by **sheet**.

num= **xlsread**(filename, sheet , xlRange, 'basic')

- Imports data from the spreadsheet in basic import mode. This is the mode used on UNIX platforms as well as on Windows when Excel is not available as a COM **server**.

15

1ST

### IMPORTING AND EXPORTING DATA

[num,text,row]= **xlsread**(filename, ...)

- Returns numeric and text data in **num** and **txt**, and unprocessed cell content in cell array **raw**, which contains both numeric and text data.

Example :- Read Data from First Worksheet into Numeric Array .

- Create an Excel file named myExample.xlsx

```

>> values = {1, 2, 3 ; 4, 5, 'x' ; 7, 8, 9};
% to define a subset of the array. Enclose indices in curly
brackets, { }, to refer to the text, numbers, or other data
within individual cells.
>> headers = {'First', 'Second', 'Third'};
>> xlswrite('myExample.xlsx', [headers; values]);
  
```

16

**IMPORTING AND EXPORTING DATA**

1ST

- Read data from the first worksheet

```
>> filename = 'myExample.xlsx';
>> A = xlsread(filename)
or
>> A = xlsread('myExample.xlsx')
A =
     1     2     3
     4     5 NaN
     7     8     9
>> [num text row]=xlsread('myExample.xlsx')
```

- ❖ xlsread returns the numeric data in array A .

17

1ST

```
>> [num text row]=xlsread('myExample.xlsx')
num =
     1     2     3
     4     5 NaN
     7     8     9
text =
'First' 'Second' 'Third'
"      "      "
"      "      'x'
row =
'First' 'Second' 'Third'
 [ 1] [ 2] [ 3]
 [ 4] [ 5] 'x'
 [ 7] [ 8] [ 9]
```

18

1ST

### IMPORTING AND EXPORTING DATA

EXAMPLE 2: READ A SPECIFIC RANGE OF DATA FROM THE EXCEL FILE IN THE PREVIOUS EXAMPLE.

```

>> filename = 'myExample.xlsx';
>> sheet = 1;
>> xlRange = 'B2:C3';
>> subsetA = xlsread(filename, sheet, xlRange)

subsetA =
     2     3
     5    NaN
    
```

19

1ST

### IMPORTING AND EXPORTING DATA

EXAMPLE 3: Import data of the outdoor temperature, Sunlight radiation, pressure and the relative humidity from nivada.xlsx Do four plots of outdoor temperature, sunlight radiation, pressure, and relative humidity versus time (hours) for Nivada dataset 2007 for four months (Jan. to Apr.)

| 1  | Year | Day of Year | Month | Day | Hour | Solar Altitude | Solar Energy(W/m <sup>2</sup> ) | Air Temp(C) | Wind Speed(m/s) | Wind Dir | Pressure(h pa) | RH % |
|----|------|-------------|-------|-----|------|----------------|---------------------------------|-------------|-----------------|----------|----------------|------|
| 2  | 2007 | 1           | 1     | 1   | 0    | -73            | 0                               | -6.9        | 0.9             | 193      | 907            | 72   |
| 3  | 2007 | 1           | 1     | 1   | 1    | -64            | 0                               | -7          | 1               | 147      | 907            | 73   |
| 4  | 2007 | 1           | 1     | 1   | 2    | -52            | 0                               | -8.4        | 0.9             | 188      | 908            | 77   |
| 5  | 2007 | 1           | 1     | 1   | 3    | -40            | 0                               | -7.8        | 1               | 194      | 908            | 78   |
| 6  | 2007 | 1           | 1     | 1   | 4    | -29            | 0                               | -9.4        | 0.9             | 174      | 908            | 81   |
| 7  | 2007 | 1           | 1     | 1   | 5    | -17            | 0                               | -8.9        | 1.1             | 193      | 909            | 82   |
| 8  | 2007 | 1           | 1     | 1   | 6    | -6             | 1                               | -7.5        | 1.3             | 180      | 909            | 78   |
| 9  | 2007 | 1           | 1     | 1   | 7    | 5              | 58                              | -6.5        | 1               | 162      | 910            | 78   |
| 10 | 2007 | 1           | 1     | 1   | 8    | 14             | 228                             | 2.5         | 1.8             | 336      | 910            | 51   |
| 11 | 2007 | 1           | 1     | 1   | 9    | 22             | 373                             | 7.7         | 2.3             | 55       | 910            | 38   |
| 12 | 2007 | 1           | 1     | 1   | 10   | 27             | 476                             | 10.4        | 4.3             | 40       | 910            | 32   |
| 13 | 2007 | 1           | 1     | 1   | 11   | 30             | 524                             | 11.8        | 6.2             | 30       | 909            | 29   |

24

**IMPORTING AND EXPORTING DATA**

1ST

4. The **xlswrite** command :- Write Microsoft Excel spreadsheet file ( .xlsx ), extracting or Exporting data .

**Syntax**

`xlswrite(filename ,A)`  
`xlswrite(filename ,A, sheet)`  
`xlswrite(filename ,A, xlRange)`  
`xlswrite(filename ,A, sheet , xlRange)`

26

**IMPORTING AND EXPORTING DATA**

1ST

**xlswrite(filename ,A)**

- Writes array **A** to the first worksheet in Excel file, **filename** , starting at cell **A1**.

**xlswrite(filename ,A, sheet)**

- Writes to the specified worksheet.

**xlswrite(filename ,A, xlRange)**

- Writes to the rectangular region specified by **xlRange** in the first worksheet of the file.

**xlswrite(filename ,A, sheet, xlRange)**

- Writes to the specified **sheet** and range, **xlRange**.

27

**IMPORTING AND EXPORTING DATA**

1ST

Example :- Write Data to a Spreadsheet First. Write a 7-element vector to an Excel file, testdata.xlsx.

```
>> filename = 'testdata.xlsx';
>> A = [12.7, 5.02, -98, 63.9, 0, -.2, 56];
>> xlswrite(filename , A)
```

Example :- Write Data to a Specific Sheet and Range in a Spreadsheet. Write mixed text and numeric data to an Excel file, testdata.xlsx, Starting at cell E1 of Sheet2.

```
>> filename = 'testdata.xlsx';
>> A = {'Time', 'Temperature'; 12,98; 13,99; 14,97};
>> sheet = 2;
>> xlRange = 'E1';
>> xlswrite(filename, A, sheet , xlRange)
```

28

1ST

## IMPORTING AND EXPORTING DATA

### Homework

Write a MATLAB program to read the numerical and analytical solutions in table (1) from excel sheet file to calculate the mean of the numerical values, "Quarter, Hourly, Simidiurnal, Diurnal"

Note: use an Excel spreadsheet to reading and writing values. Then draw each of numerical values versus the time steps.

20

1ST

## IMPORTING AND EXPORTING DATA

| LONGWAVE SOLAR RADIATION |                  |  |
|--------------------------|------------------|--|
| Time (hour)              | Wm <sup>-2</sup> |  |
| 1 10/21/2014 12:00:00    | 366.946          |  |
| 1 10/21/2014 12:15:00    | 375.059          |  |
