## 4-8- Forces of Friction

When a force $\overrightarrow{\mathrm{F}}$ tends to slide a body along a surface, a frictional force from the surface acts on the body. The frictional force is parallel to the surface and directed so as to oppose the sliding. It is due to bonding between the body and the surface. If the body does not slide, the frictional force is a static frictional force $\vec{f}_{s}$, The magnitude of $\vec{f}_{s}$ has a maximum value $f_{s, \text { max }}$, given by:

$$
\begin{equation*}
\mathrm{f}_{\mathrm{s}, \text { max }}=\mu_{\mathrm{s}} \mathrm{n}, \tag{4-8-1}
\end{equation*}
$$

where $\mu_{\mathrm{s}}$, is the coefficient of static friction and n is the magnitude of the normal force.
If there is sliding, the frictional force is a kinetic frictional force $\vec{f}_{k}$. The magnitude of $\vec{f}_{k}$ is given by:
$\mathrm{f}_{\mathrm{k}}=\mu_{\mathrm{k}} \mathrm{n}$
Where $\mu_{\mathrm{k}}$, is the coefficient of kinetic friction.

Ex: Suppose a block is placed on a rough surface inclined relative to the horizontal, as shown in figure. The incline angle is increased until the block starts to move. Show that by measuring the critical angle $\theta_{\mathrm{c}}$ at which this slipping just occurs, we can obtain $\mu_{\mathrm{s}}$.

Soln:

$$
\begin{align*}
& \sum \mathrm{F}_{\mathrm{x}}=0 \rightarrow \mathrm{mg} \sin \theta-\mathrm{f}_{\mathrm{s}}=0 \rightarrow \mathrm{f}_{\mathrm{s}}=\mathrm{mg} \sin \theta  \tag{1}\\
& \sum \mathrm{~F}_{\mathrm{y}}=0 \rightarrow \mathrm{n}-\mathrm{mg} \cos \theta=0 \rightarrow \mathrm{mg}=\frac{\mathrm{n}}{\cos \theta} \tag{2}
\end{align*}
$$

Substitute equation (2) into equation (1):
$\mathrm{f}_{\mathrm{s}}=\frac{\mathrm{n}}{\cos \theta} \sin \theta=\mathrm{n} \tan \theta$
$\mu_{\mathrm{s}}=\tan \theta_{\mathrm{c}}$

Ex: A hockey puck on a frozen pond is given an initial speed of $20.0 \mathrm{~m} / \mathrm{s}$. If the puck always remains on the ice and slides 115 m before coming to rest, determine the coefficient of kinetic friction between the puck and ice.
Soln:
$\sum \mathrm{F}_{\mathrm{y}}=0 \rightarrow \mathrm{n}-\mathrm{mg}=0 \rightarrow \mathrm{n}=\mathrm{mg}$
$\sum \mathrm{F}_{\mathrm{x}}=\mathrm{ma}_{\mathrm{x}} \rightarrow-\mathrm{f}_{\mathrm{k}}=\mathrm{ma}_{\mathrm{x}} \quad \rightarrow-\mathrm{n} \mu_{\mathrm{k}}=\mathrm{ma} \mathrm{x}_{\mathrm{x}}$
Substitute equation (1) into equation (2):
$-m g \mu_{\mathrm{k}}=\mathrm{ma}_{\mathrm{x}} \rightarrow \mathrm{a}_{\mathrm{x}}=-\mu_{\mathrm{k}} \mathrm{g}$

$\mathrm{v}_{\mathrm{xf}}^{2}=\mathrm{v}_{\mathrm{xi}}^{2}+2 \mathrm{a}_{\mathrm{x}}\left(\mathrm{x}_{\mathrm{f}}-\mathrm{x}_{\mathrm{i}}\right), \quad \mathrm{v}_{\mathrm{xf}}=0, \quad \mathrm{v}_{\mathrm{xi}}=20 \mathrm{~m} / \mathrm{s}, \quad \mathrm{x}_{\mathrm{i}}=0, \quad \mathrm{x}_{\mathrm{f}}=115 \mathrm{~m}$,
$0=v_{\mathrm{xi}}^{2}-2 \mu_{\mathrm{k}} \mathrm{gx}_{\mathrm{f}} \quad \rightarrow \quad \mu_{\mathrm{k}}=\frac{\mathrm{v}_{\mathrm{xi}}^{2}}{2 \mathrm{gx}_{\mathrm{f}}} \quad \rightarrow \quad \mu_{\mathrm{k}}=\frac{(20)^{2}}{2(9.8)(115)}=0.177$
Ex: A block of mass $m_{2}$ on a rough, horizontal surface is connected to a ball of mass $m_{1}$ by a lightweight cord over a lightweight, frictionless pulley as shown in figure below. A force of magnitude $F$ at an angle $\theta$ with the horizontal is applied to the block, and the block slides to the right. The coefficient of kinetic friction between the block and surface is $\mu_{\mathrm{k}}$. Determine the magnitude of the acceleration of the two objects.
Soln:
Apply Newton's second law to the block
$\sum \mathrm{F}_{\mathrm{x}}=\mathrm{ma}_{\mathrm{x}} \rightarrow \mathrm{F} \cos \theta-\mathrm{f}_{\mathrm{k}}-\mathrm{T}=\mathrm{m}_{2} \mathrm{a}$
$\sum \mathrm{F}_{\mathrm{y}}=\mathrm{ma}_{\mathrm{y}} \rightarrow \mathrm{n}+\mathrm{F} \sin \theta-\mathrm{m}_{2} \mathrm{~g}=0 \rightarrow \mathrm{n}=\mathrm{m}_{2} \mathrm{~g}-\mathrm{F} \sin \theta$
$\mathrm{f}_{\mathrm{k}}=\mu_{\mathrm{k}}\left(\mathrm{m}_{2} \mathrm{~g}-\mathrm{F} \sin \theta\right)$

Apply Newton's second law to the ball
$\sum \mathrm{F}_{\mathrm{y}}=\mathrm{ma}_{\mathrm{y}} \rightarrow \mathrm{T}-\mathrm{m}_{1} \mathrm{~g}=\mathrm{m}_{1} \mathrm{a} \rightarrow \mathrm{T}=\mathrm{m}_{1}(\mathrm{~g}+\mathrm{a})$
Substitute equation (4) and (3) into (1):
$\mathrm{F} \cos \theta-\mu_{\mathrm{k}}\left(\mathrm{m}_{2} \mathrm{~g}-\mathrm{F} \sin \theta\right)-\mathrm{m}_{1}(\mathrm{~g}+\mathrm{a})=\mathrm{m}_{2} \mathrm{a}$
$\mathrm{a}=\frac{\mathrm{F}\left(\cos \theta+\mu_{\mathrm{k}} \sin \theta\right)-\left(\mathrm{m}_{1}+\mu_{\mathrm{k}} \mathrm{m}_{2}\right) \mathrm{g}}{\mathrm{m}_{1}+\mathrm{m}_{2}}$

Ex: A block weighing 75 N rests on a plane inclined at $25^{\circ}$ to the horizontal. A force F is applied to the object at $15^{\circ}$ to the horizontal, pushing it upward on the plane. The coefficients of static and kinetic friction between the block and the plane are, respectively, 0.363 and 0.156 . (a) What is the minimum value of F that will prevent the block from slipping down the plane? (b) What is the minimum value of $F$ that will start the block moving up the plane? (c) What value of $F$ will move the block up the plane with constant velocity?
Soln:
a)
$\sum \mathrm{F}_{\mathrm{x}}=0$
$\mathrm{F} \cos (15)+\mathrm{f}_{\mathrm{s}}-75 \sin (25)=0$
$\mathrm{f}_{\mathrm{s}, \max }=75 \sin (25)-\mathrm{F} \cos (15)$
$\sum \mathrm{F}_{\mathrm{y}}=0$
$\mathrm{n}+\mathrm{F} \sin (15)-75 \cos (25)=0$
$\mathrm{n}=75 \cos (25)-\mathrm{F} \sin (15)$
$\mathrm{f}_{\mathrm{s}, \max }=75 \mu_{\mathrm{s}} \cos (25)-\mathrm{F} \mu_{\mathrm{s}} \sin (15)$

(a)

Equate equation (1) and (2):
$75 \sin (25)-\mathrm{F} \cos (15)=75 \mu_{\mathrm{s}} \cos (25)-\mathrm{F} \mu_{\mathrm{s}} \sin (15)$
$\mathrm{F}\left[\cos (15)-\mu_{\mathrm{s}} \sin (15)\right]=\left[75 \sin (25)-75 \mu_{\mathrm{s}} \cos (25)\right] \rightarrow \mathrm{F}=\frac{\left[75 \sin (25)-75 \mu_{\mathrm{s}} \cos (25)\right]}{\left[\cos (15)-\mu_{\mathrm{s}} \sin (15)\right]}=8 \mathrm{~N}$
b)
$\sum \mathrm{F}_{\mathrm{x}}=0$
$\mathrm{F} \cos (15)-\mathrm{f}_{\mathrm{s}}-75 \sin (25)=0$
$f_{s, \max }=F \cos (15)-75 \sin (25)$
$\sum \mathrm{F}_{\mathrm{y}}=0$
$\mathrm{n}+\mathrm{F} \sin (15)-75 \cos (25)=0$
$\mathrm{n}=75 \cos (25)-\mathrm{F} \sin (15)$
$\mathrm{f}_{\mathrm{s}, \max }=75 \mu_{\mathrm{s}} \cos (25)-\mathrm{F} \mu_{\mathrm{s}} \sin (15)$

(b)

Equate equation (3) and (4):
$\mathrm{F} \cos (15)-75 \sin (25)=75 \mu_{\mathrm{s}} \cos (25)-\mathrm{F} \mu_{\mathrm{s}} \sin (15)$
$\mathrm{F}\left[\cos (15)+\mu_{\mathrm{s}} \sin (15)\right]=\left[75 \sin (25)+75 \mu_{\mathrm{s}} \cos (25)\right] \rightarrow \mathrm{F}=\frac{\left[75 \sin (25)+75 \mu_{\mathrm{s}} \cos (25)\right]}{\left[\cos (15)+\mu_{\mathrm{s}} \sin (15)\right]}=53.2 \mathrm{~N}$
c)
$\sum \mathrm{F}_{\mathrm{x}}=0$
$\mathrm{F} \cos (15)-\mathrm{f}_{\mathrm{k}}-75 \sin (25)=0$
$f_{k}=F \cos (15)-75 \sin (25)$
$\sum \mathrm{F}_{\mathrm{y}}=0$
$\mathrm{n}+\mathrm{F} \sin (15)-75 \cos (25)=0$
$\mathrm{n}=75 \cos (25)-\mathrm{F} \sin (15)$
$\mathrm{f}_{\mathrm{k}}=75 \mu_{\mathrm{k}} \cos (25)-\mathrm{F} \mu_{\mathrm{k}} \sin (15)$

(c)

Equate equation (5) and (6):
$\mathrm{F} \cos (15)-75 \sin (25)=75 \mu_{\mathrm{s}} \cos (25)-\mathrm{F} \mu_{\mathrm{s}} \sin (15)$
$\mathrm{F}\left[\cos (15)+\mu_{\mathrm{k}} \sin (15)\right]=\left[75 \sin (25)+75 \mu_{\mathrm{k}} \cos (25)\right] \quad \rightarrow \quad \mathrm{F}=\frac{\left[75 \sin (25)+75 \mu_{\mathrm{k}} \cos (25)\right]}{\left[\cos (15)+\mu_{\mathrm{k}} \sin (15)\right]}=42 \mathrm{~N}$
Ex: Figure below shows a block $S$ (the sliding block) with mass $M$. The block is free to move along a horizontal frictionless surface and connected, by a cord that wraps over a frictionless pulley, to a second block $H$ (the hanging block), with mass $m$. The cord and pulley have negligible masses compared to the blocks. The hanging block H falls as the sliding block S accelerates to the right. Find (a) the acceleration of the two blocks, (b) the tension in the cord.

## Soln:

Apply Newton's second law to the block S:
$\sum \mathrm{F}_{\mathrm{x}}=\mathrm{Ma}_{\mathrm{x}} \rightarrow \mathrm{T}=\mathrm{Ma}$
Apply Newton's second law to the block H:

$\sum \mathrm{F}_{\mathrm{y}}=\mathrm{ma}_{\mathrm{y}} \rightarrow \mathrm{T}-\mathrm{mg}=-\mathrm{ma}$
$a=\frac{m g}{M+m}$
$\mathrm{T}=\frac{\mathrm{mM}}{\mathrm{M}+\mathrm{m}} \mathrm{g}$
